BUSINESS ANALYSIS REPORT

Instagram Performance Analytics for Sugar Cosmetics

Project Title: Instagram Performance Analytics for Sugar Cosmetics
Prepared By: Yashasvi Agarwal
Internship/Organization: labmentix
Tools Used: Microsoft Power BI, CSV Dataset
Date: 19/10/2026

---

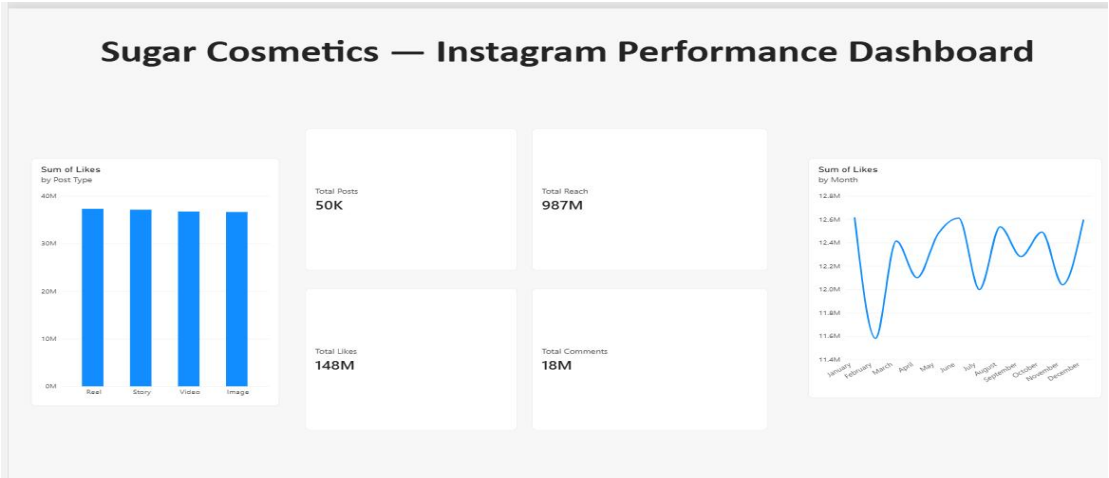

1. Executive Summary

This project focuses on analyzing the Instagram performance of Sugar Cosmetics using data visualization and business analytics. The primary objective is to understand content performance, audience engagement, campaign effectiveness, and monthly performance trends.

Microsoft Power BI was used to transform the dataset into an interactive report containing six pages of visualizations. These pages present an overview of Instagram performance, content performance, audience and campaign performance, hashtag analysis, monthly trends, and a consolidated dashboard.

The dashboard displays key performance indicators, including approximately 50,000 posts, 148 million likes, 18 million comments, and 987 million reach, based on the displayed Power BI report.

The analysis provides a structured way to examine social media performance and identify opportunities to improve content planning, audience engagement, and campaign evaluation.

2. Introduction

Social media platforms play an important role in digital marketing. Instagram allows brands to communicate with customers, promote products, increase brand awareness, and measure audience engagement.

Sugar Cosmetics is a beauty and cosmetics brand whose Instagram activity can be studied through metrics such as likes, comments, shares, saves, reach, impressions, profile visits, and follows.

This project uses data analytics to organize and visualize these metrics. The resulting Power BI report helps present social media information in an understandable format for business analysis and decision-making.

2.1 Problem Statement

Social media datasets may contain large amounts of information that are difficult to interpret through raw tables alone. Without organized analysis, it can be challenging to compare content types, evaluate campaigns, study monthly changes, and identify useful performance patterns.

This project addresses the problem by developing an interactive Power BI report that presents Instagram performance through KPIs, charts, and trend visualizations.

2.2 Project Objectives

The main objectives are:

1.To analyze the overall Instagram performance of Sugar Cosmetics.

2.To compare engagement across different post types.

3.To examine reach, impressions, shares, and saves.

4.To analyze profile visits and follows.

5.To compare performance across campaign types and hashtags.

6.To study monthly trends in likes, comments, reach, and impressions.

7.To present the analysis through an organized Power BI dashboard.

8.To support data-driven social media marketing decisions.

3. Dataset Description

The project uses a CSV dataset containing Instagram post information and performance metrics.

The dataset includes fields related to publication dates, content categories, audience engagement, campaign classifications, and engagement sources.

3.1 Important Dataset Columns

Column	Description
Post_Date	Date associated with a post
Post_Type	Category or format of the post
Likes	Number of likes received
Comments	Number of comments received
Shares	Number of times content was shared
Saves	Number of times content was saved
Reach	Number of accounts reached
Impressions	Number of times content was displayed
Hashtags	Hashtags associated with the content
Caption	Text associated with a post
Profile Visits	Visits to the profile associated with the activity
Follows	Follows recorded in the dataset
Campaign Type	Campaign classification
Engagement Source	Source or category associated with engagement

3.2 Importance of the Dataset

The dataset supports several types of analysis. Engagement metrics help compare audience interactions, while reach and impressions help examine content visibility. Post types, hashtags, and campaign categories provide additional dimensions for comparing performance.

The date field supports monthly trend analysis, allowing performance measures to be examined over time.

4. Tools and Technologies Used

4.1 Microsoft Power BI

Power BI was used to create visualizations, display key performance indicators, compare categories, and build a multi-page analytical report.

The main features used include:

1.KPI cards for summary metrics.

2.Bar and column charts for category comparisons.

3.Line charts for monthly trends.

4.Report pages for organizing different analytical topics.

5.Visual formatting and labels for improving readability.

4.2 CSV Dataset

The CSV file served as the source of the project data. It provided the information required to construct the charts and performance indicators.

4.3 Data Visualization

Charts make it easier to compare categories and observe trends than reading a large table of raw records. The visualizations were organized into six pages according to their analytical purpose.

5. Data Preparation and Methodology

The project followed a structured workflow to convert the dataset into a Power BI report.

5.1 Data Import

The CSV dataset was imported into Microsoft Power BI. The available fields were reviewed to identify numerical measures, dates, and categorical fields.

5.2 Data Type Review

Fields were reviewed according to their intended use:

1.Date fields were used for time-based analysis.

2.Numerical fields such as Likes, Comments, Shares, Saves, Reach, and Impressions were used for quantitative analysis.

3.Categorical fields such as Post_Type, Campaign Type, Hashtags,and Engagement Source were used for grouping and comparisons.

4.Text fields, including Caption, were treated as descriptive information.

5.3 Data Visualization

Charts were created to compare metrics across post types, hashtags, and campaign categories. Line charts were used to examine monthly trends.

5.4 Dashboard Development

The report was organized into six pages. Each page focuses on a different aspect of Instagram performance, while the final page consolidates important metrics and charts.

5.5 Analytical Approach

The analysis is descriptive and comparative. It presents the available metrics and examines differences between categories and changes over time.

The report does not assume that a particular content type or campaign caused a change in performance. Such conclusions would require further evidence.

6. Power BI Report Analysis

6.1 Page 1: Overall Instagram Performance

This page provides a general overview of Instagram performance using KPI cards and a chart comparing likes across post types.

The displayed KPI cards include:

Total Posts: Approximately 50K, displayed using a count of Post_Date.

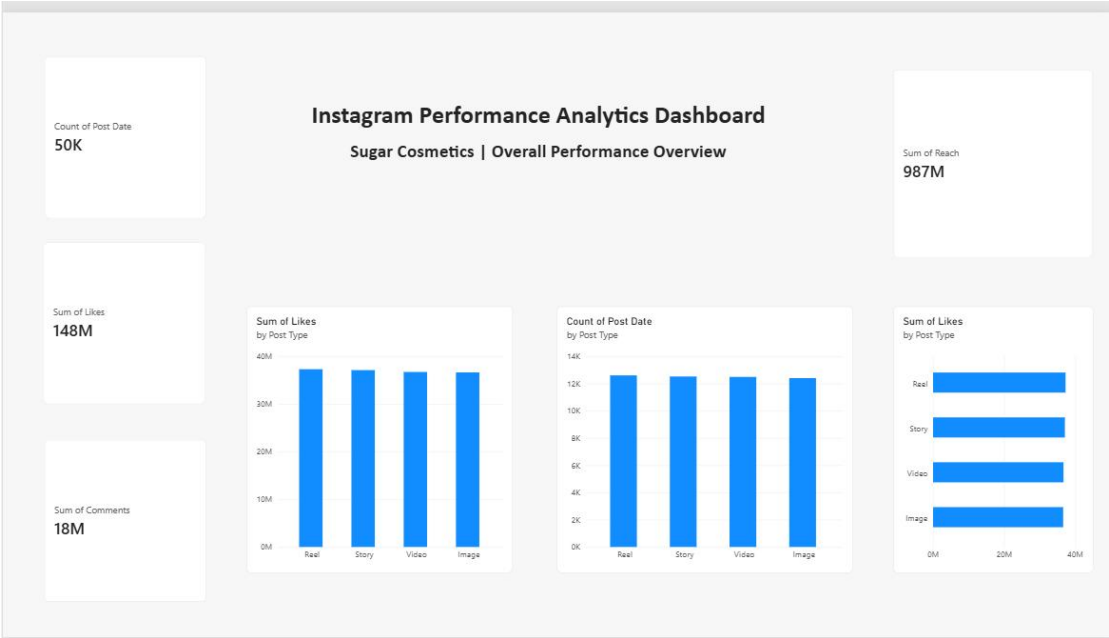

Total Likes: Approximately 148M.

Total Comments: Approximately 18M.

Total Reach: Approximately 987M.

The Likes by Post Type chart provides a comparison of likes across the post categories available in the dataset.

This page serves as the starting point for the analysis. It summarizes the scale of the dataset and presents a first comparison of content performance.

Analysis notes to complete from the chart:

1.Highest-performing post type by likes: **Reel.**

2.Lowest-performing post type by likes: **Image**

3.Main observation**: Reels received more likes than other post types in the dataset**

6.2 Page 2: Content Performance Analysis

This page examines content performance through four visualizations:

1.Shares by Post Type

2.Saves by Post Type

3.Reach by Post Type

4.Impressions by Post Type

Shares by Post Type

This chart compares the number of shares across post categories. Shares can help indicate which content formats audiences distribute to others.

Saves by Post Type

This chart compares saves across post categories. Saves may help identify content that audiences want to revisit, although the number alone does not explain why users saved it.

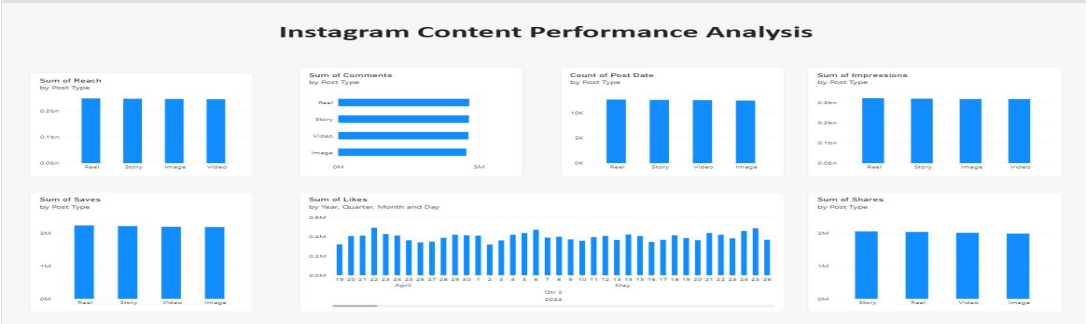

Reach by Post Type

This visualization compares the reach associated with different post types. It helps evaluate how content categories differ in audience exposure.

Impressions by Post Type

This chart compares impressions across content categories. Impressions measure how many times content was displayed, rather than the number of unique accounts reached.

Together, these charts provide a broader view of content performance beyond likes and comments.

Key observations to complete:

1.Post type with the highest shares: Story

2.Post type with the highest saves:Reel

3.Post type with the highest reach: Reel

4.Post type with the highest impressions: Reel

6.3 Page 3: Audience and Campaign Performance

This page explores profile visits, follows, and campaign-related performance.

The visualizations include:

1.Profile Visits by Post Type

2.Follows by Post Type

3.Reach by Campaign Type

4.Likes by Campaign Type

Profile Visits by Post Type

This chart compares profile visits across post categories. It helps examine which categories are associated with more profile traffic in the dataset.

Follows by Post Type

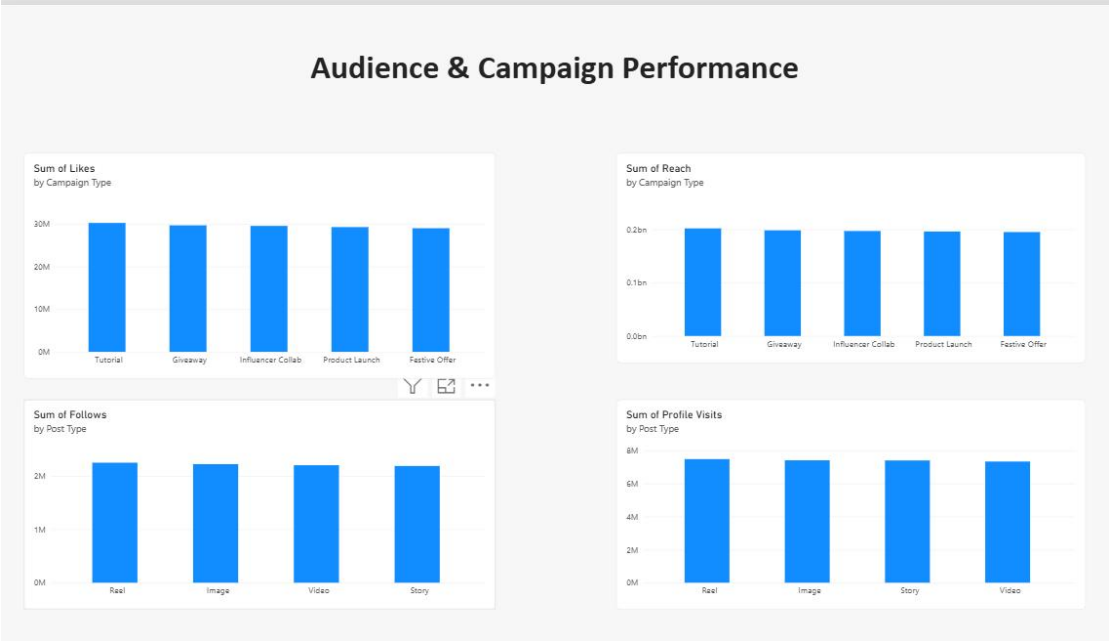

This visualization compares follows across post categories. It can help identify categories associated with audience growth.

Reach by Campaign Type

This chart compares campaign categories based on reach. It helps assess the distribution of audience exposure across the campaign types represented in the dataset.

Likes by Campaign Type

This visualization compares likes across campaign categories. It provides another way to evaluate campaign performance using audience interactions.

Key observations to complete:

1.Post type with the highest profile visits: Reel

2.Post type with the highest follows: Reel

3.Campaign type with the highest reach: Tutorial

4.Campaign type with the highest likes: Tutorial

6.4 Page 4: Hashtag and Campaign Performance

This page focuses on hashtag-related performance and campaign comparisons. Its visualizations include Likes by Hashtags and Impressions by Campaign Type, along with the additional charts included on the page.

Likes by Hashtags

This chart compares likes associated with the hashtags represented in the report. It can help identify which hashtags appear alongside content receiving more likes.

However, higher likes associated with a hashtag do not establish that the hashtag itself caused the higher engagement.

Impressions by Campaign Type

This visualization compares impressions across campaign categories. It helps examine how often content associated with each campaign type was displayed.

Additional Visualizations

The remaining charts on this page provide supplementary comparisons between hashtags, campaigns, or their related performance metrics, depending on the fields selected in Power BI.

Key observations to complete:

1.Hashtag associated with the highest likes: #MakeupGoals

2.Campaign type with the highest impressions: Tutorial

3.Other notable pattern**:** Monthly reach and impressions fluctuate throughout the year, with higher values in some months and noticeable declines in others. The Tutorial campaign type has the highest impressions, while #MakeupGoals is among the hashtags associated with the highest likes.

6.5 Page 5: Monthly Performance Trends

This page uses line charts to examine changes in performance over time.

The four visualizations are:

1. Monthly Reach Trend
2. Monthly Impressions Trend
3. Monthly Likes Trend
4. Monthly Comments Trend

Monthly Reach Trend

This chart shows how reach changes across months. It helps identify periods with relatively higher or lower reach.

Monthly Impressions Trend

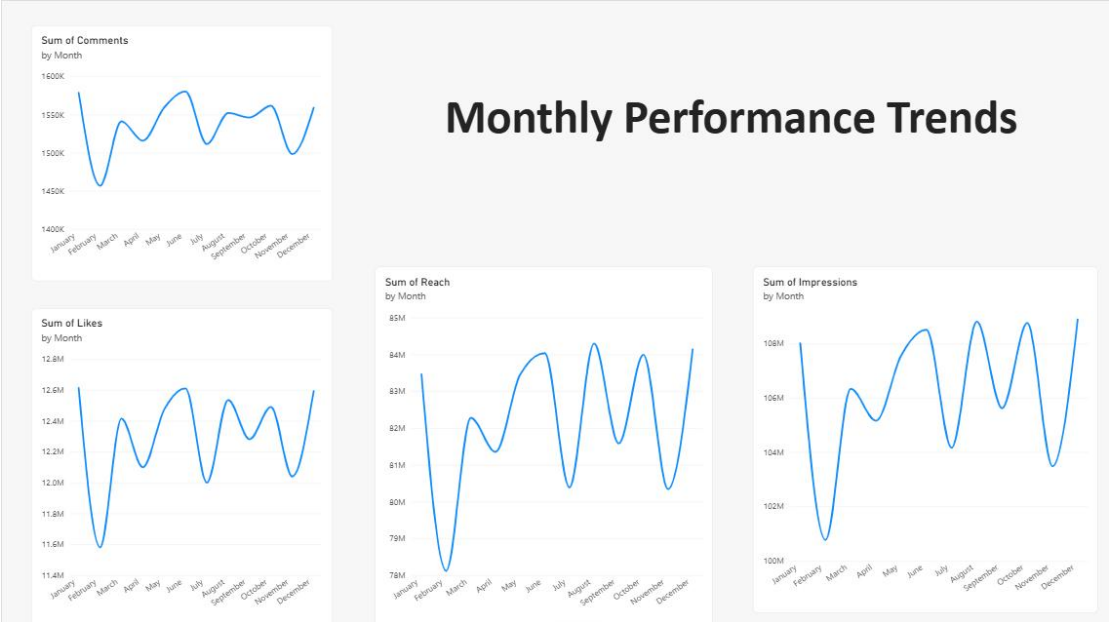

This chart displays monthly changes in impressions. Comparing it with reach may help identify differences between content exposure and the number of accounts reached.

Monthly Likes Trend

This visualization tracks likes across months. It helps examine whether audience interactions increased, decreased, or fluctuated during the period represented in the dataset.

Monthly Comments Trend

This chart examines monthly changes in comments. It can help identify periods with relatively higher or lower commenting activity.

Key observations to complete:

1. **Month with the highest reach:** August
2. **Month with the highest impressions:** August
3. **Month with the highest likes:** January
4. **Month with the highest comments:**June

5.Overall monthly pattern: Instagram performance fluctuates throughout the year rather than following a consistent upward or downward trend. Reach, impressions, likes, and comments vary across months, indicating changes in content visibility and audience engagement over time.

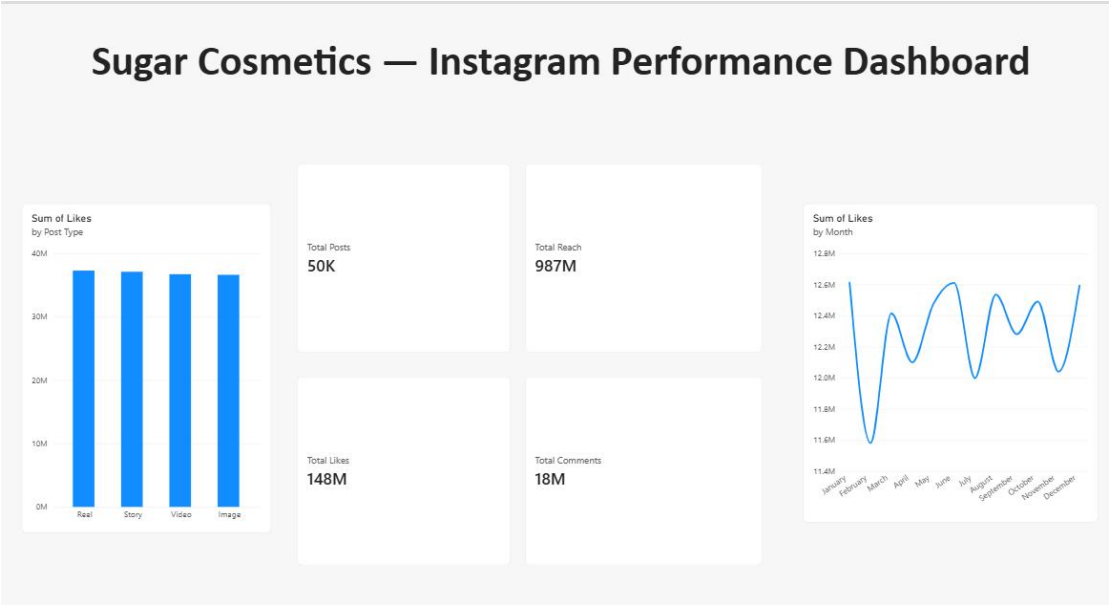

6.6 Page 6: Final Instagram Performance Dashboard

The final page consolidates important performance indicators and selected charts into a summary dashboard.

It includes KPI cards and visualizations such as Likes by Post Type and Monthly Likes Trend.

The purpose of this page is to make important information accessible without requiring the viewer to navigate through every analytical page.

The summary dashboard can be used as an overview for presentations and discussions about Instagram performance. The detailed pages remain useful for investigating individual metrics and category comparisons.

7. Key Findings

The project provides a foundation for examining Instagram performance through multiple dimensions.

Based on the currently available dashboard figures, the following observations can be reported:

1.The report contains approximately 50,000 counted post-date entries, as

displayed by t he Total Posts card.

2.The displayed Total Likes value is approximately 148 million.

3.The displayed Total Comments value is approximately 18 million.

4.The displayed Total Reach value is approximately 987 million.

5.Performance can be compared across post types using likes, shares, saves, reach, and impressions.

6.Campaign categories can be examined using reach, likes, and impressions.

7.Monthly trend charts make it possible to investigate changes in reach, impressions, likes, and comments over time.

The highest-performing categories and peak months should be added after checking the actual charts. The figures above are dashboard totals and should not be interpreted as evidence of growth or campaign success without further comparison.

8. Business Recommendations

The following recommendations can guide further analysis and social media planning. They should be refined using the category-level results from the dashboard.

8.1 Review Content Performance

Compare post types using multiple metrics, including likes, shares, saves, and reach. Avoid selecting a content format based on likes alone, because different metrics represent different forms of audience response.

8.2 Improve Campaign Evaluation

Evaluate campaign categories using reach, impressions, and likes together. Where campaign cost or conversion data is available, include these measures to assess business effectiveness more directly.

8.3 Use Hashtag Analysis Carefully

Review the hashtags associated with higher-performing content. Test hashtag combinations in future posts and compare the results while considering other factors, such as post type, campaign, and publication timing.

8.4 Monitor Monthly Trends

Review monthly performance regularly to identify unusual increases or decreases. Investigate possible explanations using campaign dates, content calendars, and other relevant information.

8.5 Evaluate Audience Growth

Use profile visits and follows together to study audience interest and growth. If the necessary data is available, calculate a follow conversion rate using an appropriate and consistent definition.

8.6 Establish Clear KPIs

Define measurable objectives for reach, engagement, audience growth, and campaign performance. Compare results against previous periods or established targets rather than interpreting totals in isolation.

9. Limitations of the Analysis

The project has several limitations:

1.The analysis depends on the fields and records available in the supplied dataset.

2.Aggregate totals do not independently establish whether performance improved over time.

3.High likes or reach do not necessarily indicate increased sales or revenue.

4.Hashtag and campaign comparisons show associations, not proof of causation.

5.Additional information, such as advertising spend, conversions, sales, and campaign objectives, would be needed for a more complete business evaluation.

6.Category-level conclusions and monthly peaks should be verified against the actual charts before final submission.

10. Conclusion

The Instagram Performance Analytics project demonstrates how Microsoft Power BI can be used to organize social media data into a structured and interactive report.

The six-page report covers overall performance, content comparisons, audience and campaign metrics, hashtag analysis, monthly trends, and a consolidated dashboard.

By bringing multiple metrics together, the report makes it easier to explore content performance and identify areas for further investigation. The analysis can support more informed social media planning when combined with clear business objectives and regular performance reviews.

Overall, the project provides practical experience in data preparation, visualization, descriptive analysis, and dashboard development.

11. Future Scope

The project can be extended in the following ways:

1.Add engagement-rate calculations using a clearly defined formula.

2.Include campaign spending and cost-per-result metrics.

3.Connect conversions or sales data to evaluate business outcomes.

4.Compare performance across additional time periods.

5.Add interactive filters for post type, campaign, hashtag, and date.

6.Establish targets and compare actual results against them.

7.Automate data refreshes when a reliable updated data source is available.

These improvements could make the report more useful for ongoing marketing analysis and business decision-making.
